

ENVIROCAST®: INCREASING NONPOINT SOURCE POLLUTION PREVENTION THROUGH WATERSHED AWARENESS IN THE UPPER TRINITY RIVER WATERSHED

PROJECT #01-19
FY06-08 CWA SECTION 319(h)

FINAL REPORT

PREPARED BY:
NORTH CENTRAL TEXAS COUNCIL OF GOVERNMENTS
ARLINGTON, TEXAS

MAY 28, 2008

ACKNOWLEDGEMENTS

This project was administered and awarded funding by the Texas State Soil and Water Conservation Board (TSSWCB) under the Clean Water Act (CWA) §319(h) Agricultural/Silvicultural Nonpoint Source Grant Program in Texas. Grant funds were distributed to the TSSWCB through the U.S. Environmental Protection Agency (EPA) as appropriated by Congress. The North Central Texas Council of Governments (NCTCOG) coordinated with StormCenter Communications, Inc. and CBS/KTVT-11 Dallas/Fort Worth to meet the terms of the TSSWCB Federal Funded Agreement.

EXECUTIVE SUMMARY

The Envirocast® project, branded as e-Life, or Environmental Quality of Life, was an innovative project that sought to increase awareness about local environmental issues and to promote individual, voluntary measures that the public can take to protect watershed resources in North Central Texas. In order to help North Central Texans better understand the factors that influence their environmental quality of life, the e-Life project, in a partnership with the Texas State Soil and Water Conservation Board, U.S. Environmental Protection Agency- Region 6, North Central Texas Council of Governments, CBS/KTVT-11, and StormCenter Communications, Inc., featured two main elements. One component consisted of on-air broadcasting of environmental tips and stories, and the other was a specialized web site about the Upper Trinity River Watershed where visitors were able to learn more about their local environment.

The e-Life project was modeled after Washington D.C.'s Envirocast®, which was designed to raise awareness of the Chesapeake Bay Watershed. Like Envirocast® and other similar projects across the nation, e-Life employed local television weather reports as a means to raise the environmental awareness of the region's residents. Research shows that weather is the top reason 80 percent of Americans watch local news. In addition, for most Americans, the weather report is their only consistent exposure to science in any form.

The broadcasting and on-line components of the e-Life project had the potential to provide watershed information to nearly 2.3 million television viewing households in 31 counties and brought 101,557 visitors to the project website. Since the e-Life project began in March 2006, 283 on-air stories ran a total of 362 times and 77 on-line stories and at least 20 different educational features were posted to the project website. While a systemic change in the public's attitude and behavior as a result of this project to protect watershed resources in North Central Texas is difficult to measure, e-Life has nevertheless had a positive effect on the region's environmental awareness and quality.

INTRODUCTION

The project “Envirocast®: Increasing Nonpoint Source Pollution Prevention through Watershed Awareness in the Upper Trinity River Watershed” introduced local-level environmental news and information. This news and information was specifically designed to raise citizen’s understanding, appreciation, and treatment of environmental issues at the watershed scale. The project made environmental science accessible to a significantly larger audience than any previous education program in the North Central Texas region and the Upper Trinity River Watershed.

The principal goal of this project was to improve water quality in the Upper Trinity River Watershed. The strategy used to achieve this goal was initiation of a local public education process that would dramatically increase awareness about local environmental conditions and to promote individual, voluntary measures that the public can take to prevent nonpoint source (NPS) pollution. This effort was designed to catalyze systemic change in the attitude and behavior of citizens by exposing them to a mix of media in which environmental science and meteorological expertise were packaged together, enhancing viewer receptivity to the environmental messages. This project therefore expanded the role of local TV weather reporting, allowing weather reports to serve also as a recognized source for local environmental information and providing an increased audience for environmental education.

The Upper Trinity River Watershed encompasses the largest population center in Texas (Figure 2). The media is the most effective method reaching a significant population; however, in such a large media market it has been cost prohibitive for local public entities to conduct extensive media outreach capable of effectively reaching the North Central Texas public. More affordable media outreach efforts have been necessarily limited in scope. According to Nielsen Media Research, the Dallas-Fort Worth region is the 7th largest TV Designated Market Area (DMA) (Figure 1) in the nation with the potential to provide NPS pollution prevention information to nearly 2.3 million TV viewing households in 31 DMA counties.

Figure 1: KTVT Designated Market Area (DMA) coverage by county.

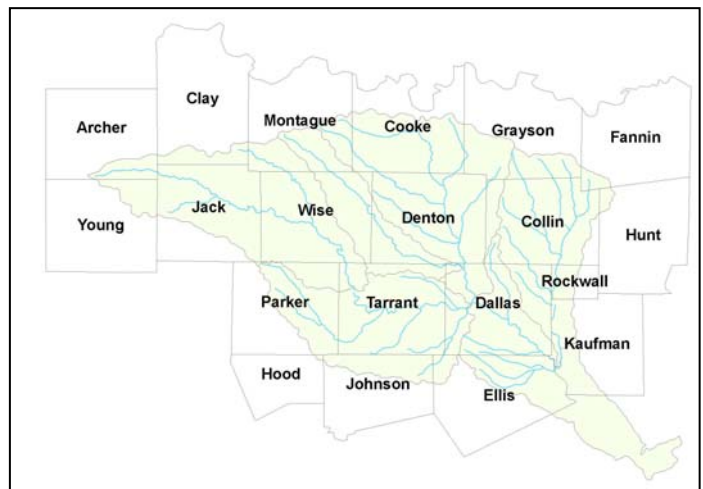

Figure 2: Map of the Upper Trinity River Basin boundary shown by counties.

The e-Life project was able to take advantage of this market and drive key messages on a consistent basis via the daily weathercast—the number one reason people watch local news. People are in a learning mode when they tune in to get the weather report which provided a great opportunity to tie the weather report with environmental learning to reach an already captive audience. Key environmental messages were also presented as part of the newscast. The weathercast and newscast were also connected to a project website, where more in-depth

FINAL REPORT

watershed and NPS information was provided.. This project provided the distribution and communication mechanism necessary to get environmental science information to the public effectively and efficiently.

Increasing population growth in the North Central Texas region will continue to impact Texas' natural resources, particularly the quality of water resources. This broad-based effort addressed both urban and rural causes and sources of NPS pollution, presented information on other environmental issues, and provided an unprecedented depth to critical education in the Upper Trinity River Watershed. The North Central Texas Council of Governments (NCTCOG) worked with StormCenter Communications, Inc., a Dallas-Fort Worth TV station (KTVT CBS-11), and an extensive network of local stakeholders to conduct this project.

RESULTS

NCTCOG entered into two one-year contracts with StormCenter Communications, Inc. from March 2006 to March 2007 and March 2007 to April 2008 to carry out the tasks outlined in the contracts. For the past two years, NCTCOG has been overseeing and coordinating the work performed under these contracts and work scopes.

The two main elements of the e-Life project consisted of on-air broadcasting of environmental tips and stories, and a specialized web site about the Upper Trinity River watersheds where visitors were able to learn more about their local environment. The on-air and on-line components of the e-Life project were deemed the most efficient and effective ways to disseminate environmental science information to the public to equip them with the proper knowledge needed to protect our water resources and our overall environment. The tasks carried out from March 2006 to April 2008 supported these project components.

On-Line Component

The e-Life website debuted on April 20, 2006. The project website consisted of 6 major sections: "Home", "Our Watersheds", "Learning Center", "Resources", "Media", and "Environmental News". The design of the website was organized by StormCenter, and the content for each section was developed by StormCenter, the Local Content Providers Network (LCPN), and/or CBS/KTVT-11. Additional features designed to educate the public on specific aspects of the environment, particularly water resources, are included under the major sections of the project website.

Home

The "Home" page of the e-Life project website (Appendix A) resembled the format of the other Envirocast® markets' home page; however, each Envirocast® home page is unique to the market area. In this case, the graphics, visual aids, and links as showcased on the "Home" page were almost entirely unique to the Upper Trinity River Watershed. The "Home" page also featured e-Life's newest features as they were developed throughout the project cycle, including the most-recent on-line and on-air environmental news stories (ENS), and other popular features. Promotional and informational videos from CBS/KTVT-11 meteorologists introducing the e-Life initiative were also included on this page.

Our Watersheds

The "Our Watersheds" page (Appendix B) introduced the term "watershed" by describing the Upper Trinity River Watershed. Additional watershed-related educational features, where viewers could go to learn more, were provided on this page.

About the Upper Trinity River Watershed

The "About the Upper Trinity River Watershed" (Appendix C) page provided information on the Trinity River, main branches of the Upper Trinity, water quality, topography, and climate and geography.

Find Your Local Watershed

The "Find Your Local Watershed" page (Appendix D) consisted of an interactive feature that allowed the public to type in their zip code to find the watershed that they live in. The boundaries of the individual sub-watersheds across the North Texas region were outlined in the following maps: state boundary map, satellite image map, Digital Elevation Model (DEM) map, and forest density map. Boundaries of a total of 20 sub-watersheds were provided in these maps.

FINAL REPORT

Detailed information was included for 10 of these 20 sub-watersheds (Appendix E). The following information was provided: counties, main water bodies, watershed health, how you can help protect your watershed, fun things to do in this watershed, and local resources. These 10 sub-watersheds are part of the Upper Trinity River Watershed. For the remaining 10 sub-watersheds not part of the Upper Trinity River Watershed, a link outside of the project website to learn more about that particular sub-watershed was provided (Appendix F).

Real-Time Information

The following real-time information was provided for several locations throughout the North Central Texas region and/or the Trinity River basin: graphical warnings (i.e. tornado, thunderstorm, etc.), stream flow, river/stream flow gauges, and rainfall, lake, and river level data. See Appendix G, H, I, J, and K for the real-time information web pages.

Calendar of Events

The “Calendar of Events” page (Appendix L) allowed for the public to view any upcoming environmental events taking place across the North Texas region. Communities within the Upper Trinity River Watershed were also able to submit their events for consideration to be added to the “Calendar of Events” page. Members of the LCPN and other community groups submitted a total of approximately 355 environmental outreach events that occurred throughout the project period for posting to the “Calendar of Events”.

Links to Local Organizations

In order for the public to learn more about organizations in the Upper Trinity River Watershed, a list of local organizations as well as a link to their websites was provided (Appendix M) on the project website.

Regional Watersheds

A map of watersheds across the U.S. was provided on the “Regional Watersheds” page (Appendix N). When clicking on a specific watershed, a new page is accessed that provided the following information on that particular watershed: geographic features, about the watershed, key issues, useful links, and regional and local watershed organizations (Appendix O).

Learning Center

The “Learning Center” page (Appendix P) contained interactive features that were not necessarily unique to the Upper Trinity River Watershed, but that were fun, informative and provided general information on watersheds, forests, and coasts. The e-Life LCPN also created a new feature that was unique to the Upper Trinity River Watershed. This feature provided information on recreation and the outdoors to highlight the impacts of water quality impairments on recreational uses in the watershed. StormCenter turned this content into a visually appealing interactive graphic similar to the watersheds, forests, and coasts features. See Attachment A to view these graphics. Note that Attachment A exists in a CD format due to the large file size.

Resources

The “Resources” page (Appendix Q) was designed to provide the public with additional information related to the topics below.

Local Resources

The “Local Resources” page (Appendix R) provided 66 links where the public could go for more information about Upper Trinity River Watershed topics including: information especially for

FINAL REPORT

children and youth, air quality, area lakes, creeks and watersheds, landscaping resources, natural resource conservation, recycling and household hazardous waste management, storm water, outdoor learning, water conservation, and weather.

Web Links

Links to 45 national and regional environmental programs targeting adults and children (the majority of which programs provided information on water) were included on the “Web Links” page of the project website (Appendix S).

Organizations

The “Organizations” page (Appendix T) provided a list and links to 33 national watershed organizations.

Brochures

15 educational brochures were listed on and accessible from the “Brochures” page (Appendix U). These focused on water quality, water conservation, watershed protection, groundwater, climate change, and coastal area resources.

Watershed Tips

The “Watershed Tips” page (Appendix V) provided a list of 45 resources and links with information on what the public can do at home, in the garden, at work, and while on vacation to protect their local watershed.

SmartScape® Tips

A list of 14 facts was provided on the “SmartScape® Tips” page (Appendix W) to inform the public about the environmental, aesthetic, and economic advantages of using native and adapted plants in residential landscapes. Texas SmartScape® is a program that encourages the use of these plants because they require less water, pesticides, fertilizers, and herbicides, and therefore protect water resources.

Forest Facts

The “Forest Facts” page (Appendix X) provided 31 pieces of information on the importance of trees and forests as related to air quality, recreation, storm water management, and other environmental benefits.

Coastal Facts

A list of 16 facts was provided on the “Coastal Facts” page (Appendix Y). The facts touched on the biological importance of coastal areas as well as the effect of impervious surfaces and NPS pollution in threatening our coastal waterways.

Glossary

The “Glossary” page (Appendix Z) consisted of 6 links to federal, state, and/or non-profit sites that provide definitions of terms often seen in environmental applications.

Recreation

The “Recreation” page was the most recent addition to the project website. These pages were linked to the recreation feature on the “Learning Center” page. The main page (Appendix AA)

FINAL REPORT

offered a definition of storm water pollution, explained its importance, and listed some of the common sources of water pollution. For each of the 7 common sources of water pollution, the following information was provided: an interesting fact, origins of the source/problem, a description of the problem, how the problem affects recreational activities, and what the public can do to help prevent this nonpoint source of pollution from entering our waterways. See Appendix AB, AC, AD, AE, AF, AG, and AH for the web pages that described the following common sources of storm water pollution and their effects on water and recreation activities: dirt/sediment, litter, motor oil/fuel, detergent, pet/people waste, fertilizers/pesticides, and grass clippings/leaves.

Media

See the On-Air Component for more detailed information. The on-air ENS that were broadcast on CBS/KTVT-11 were also uploaded to the project website and were placed under one or more of the following 10 different categories depending on their subject: Public Action, Wildlife Features, Energy Alternatives, Atmospheric Conditions, Land Features, Watershed Features, Eye on the Environment, Watershed Series, Extended Interviews, and Exclusive News—displayed on the “Media” page (Appendix AI). See Appendix AJ, AK, AL, AM, AN, AO, AP, AQ, AR, and AS for the respective category pages.

Additional media features were developed and launched on the project website as part of the “Watershed Features”, including two computerized flyovers of the West Fork and Elm Fork watersheds. A flyover of the U.S. regional watersheds was also uploaded to the project website. The watershed boundaries were outlined and water bodies such as lakes and rivers were identified in the local watersheds. See Attachment B to view the West Fork and Elm Fork flyovers.

Environmental News

The content for on-line environmental news stories (ENS) was developed primarily by the LCPN—a group made up of 62 stakeholders representing 35 entities in the North Central Texas region (Appendix AT). Over the past two years, the LCPN developed 120 story ideas for submission as either on-line and/or on-air ENS. These ideas were either submitted to NCTCOG via email or a list was generated (Appendix AU) at each of the 8 LCPN meetings held throughout the project period. See Attachment C for LCPN meeting summaries.

A total of 77 ENS (Appendix AV and AW) were posted on the project website covering a variety of topics. The majority (~64%) of these stories focused on water quality and offered steps the public can take to reduce NPS pollution to protect our water resources. The remaining on-line ENS covered topics such as air pollution, solid waste, land management, wildlife, and energy efficiency. 24 of the 77 on-line ENS are included in pdf format in Attachment D. These 24 stories represent the variety of topics covered in the on-line ENS.

On-Air Component

The first e-Life on-air ENS was broadcast on April 20, 2006. Since the on-air debut, a total of 283 e-Life related stories were produced and aired on CBS/KTVT-11. Five of these stories were part of the “Watershed Series” (Appendix AX), seven were part of the “Eye on the Environment Series” (Appendix AY), and the remaining 271 (Appendix AZ) were developed as part of the on-going on-air component of e-Life. Content for the on-air ENS was generated by CBS/KTVT-11, StormCenter, and the LCPN.

Environmental News Stories

Content generation for the on-going on-air component of e-Life was a collaborative effort primarily among StormCenter and CBS/KTVT-11. The LCPN also provided some story ideas to CBS/KTVT-11 via emails from NCTCOG. The 271 on-air ENS covered a variety of topics as listed

FINAL REPORT

under the Media section on page 10. 82 of these stories were considered to be Watershed Features that provided the public with the information and resources necessary to have a better understanding of their local watershed. The on-air ENS were broadcast as part of the newscast in the morning, afternoon, evening, and/or nightly news and viewers were directed to the project website to learn more about the Upper Trinity River Watershed. The majority of these stories were broadcast in the evening news. See Attachment E to view a handful of these vignettes.

Watershed Series

A 5-part “Watershed Series” was developed to educate the public on the Upper Trinity River Watershed, with each of the five segments airing adjacent to the weather forecast. Part 1 defined the term “watershed” and addressed NPS pollution. Parts 2 and 3 focused on two common sources of water pollution—lawn care products and litter. Parts 4 and 5 addressed the impacts of water pollution on drinking water sources and the importance of water conservation. Tips on how the public can do their part to protect local watersheds were also presented and viewers were directed to the project website to learn more. See Attachment F to view all 5 parts of the “Watershed Series”.

Eye on the Environment Series

The “Eye on the Environment Series” consisted of seven educational vignettes that were aired adjacent to the weather forecast a total of 86 times from May 2007 to April 2008. The first two vignettes focused on water pollution and smart growth; the 3rd, 4th, and 5th vignettes focused on air quality and transportation, and the final two focused on recycling. All seven vignettes addressed different aspects of the environment that impact quality of life. Each vignette offered tips viewers could apply to their daily lives and directed viewers to the e-Life project website for more information. See Attachment G to view all seven parts of the “Eye on the Environment Series”.

Project Promotion

The e-Life project was promoted and publicized by NCTCOG, StormCenter, and/or CBS/KTVT-11 to stakeholders and North Central Texas residents through approximately 27 one-time or on-going features, items, or activities. For a complete listing, see Appendix BA. The LCPN also promoted e-Life through a variety of means, such as school presentations, web site links to the project web page, word of mouth, special events, etc.

DISCUSSION

The e-Life project has equipped the public with the information necessary to help protect watershed resources in North Central Texas. The on-line and on-air components of the project introduced environmental news and information to the public through two very important distribution avenues to raise citizen's understanding, appreciation, and treatment of environmental issues at the watershed scale.

On-line and On-air ENS Relationships

Since the on-line and on-air components of the project debuted on April 20, 2006 at least 101,557 (Appendix BB) people visited the project website and at least 80,720 (Appendix BC) people tuned in to watch the evening news on CBS/KTVT-11. This coupling of on-line and on-air ENS and information was a successful piece of the project that drove viewers to the project website to access more information. For Phase I and Phase II, daily website statistics showed that there was more activity on the project website on days when CBS/KTVT-11 aired an ENS. On days when an ENS was aired, the average number of page loads and unique visitors to the project website was higher than on days when an ENS was not aired (162.19 and 76.70 versus 122.15 and 61.42, respectively) as indicated in Appendix BD, BE, and BF. The e-Life project is referred to in the airing of an ENS by mention from the meteorologist or newscaster or by a banner that appears on the screen. This reference to the e-Life project appears to have motivated CBS/KTVT-11 viewers to visit the e-Life website the same day of the airing to learn more.

On-line Component

The on-line component of the e-Life project provided watershed and other environmental information designed for residents of North Central Texas and the Upper Trinity River Watershed. The e-Life website offered high quality, educational information and tips the public could apply to their daily lives. Approximately 101,557 people visited the e-Life website throughout the life of the project. StormCenter currently manages 11 Envirocast® markets and the Dallas-Fort Worth e-Life site ranked 3rd among these markets for the number of website page loads.

According to Appendix BB, website visitors were, on average, viewing approximately 2 pages per visit. About 1 in 9 visitors were returning while 8 in 9 were first time visitors. This indicates that more people are familiar with the e-Life project, but are not taking advantage of the resources the website has to offer.

Not all visitors to the project website live in the North Central Texas region. However, website analytics were not able to identify the specific location of the website visitors. The assumption that some visitors are outside the region may help explain why visitors are only viewing, on average, approximately 2 pages per visit. Internet surfers from around the U.S. may be brought to the e-Life project website through a search engine, but if they are not located in the DFW area or the Upper Trinity River Watershed they may not feel inclined to explore the website.

LCPN members, StormCenter, NCTCOG, and CBS/KTVT-11 staff were responsible for a portion of the website page load statistics. These project partners, particularly StormCenter and NCTCOG, visited the website on a consistent basis for website maintenance purposes or to locate information for reporting purposes. For instance, NCTCOG staff visited the website more regularly and viewed more pages in one visit from January to February 2008 in order to prepare for the final reports. This may be one reason for an increase in the number of returning visitors and page loads in February 2008.

On-air Component

The on-air component of the e-Life project offered a visual, clear way to showcase newsworthy environmental initiatives and events that may not have otherwise been publicized. The majority of

FINAL REPORT

on-air ENS were broadcast during the CBS/KTVT-11 weekday evening news, and according to Nielson Media Research (Appendix BC), an average of at least 80,720 people tuned in to view the 4 p.m., 5 p.m., and 6 p.m. weekday newscasts throughout the project period. The Dallas-Fort Worth Envirocast® market ranked 2nd out of the 11 markets managed by StormCenter for the production of on-air ENS.

This avenue of watershed and environmental education reached a more diverse and broader audience than the on-line component. Assuming that these 80,720 viewers caught the ENS, CBS/KTVT-11 was successful at educating the general public about local environmental issues, in order to promote individual, voluntary measures that the public can take to protect resources in North Central Texas.

Viewers of news programming come from various backgrounds; therefore, not all were aware of the factors that influence their environmental quality of life. When tuning in to get local weather and news reports, they are in a learning mode. This provided a great opportunity to reach an already captive audience by running environmental messages on a consistent basis adjacent to the weather and news reports. There is no evidence that these environmental message increased watershed awareness and favorable attitudes, but the more the viewers were exposed to these messages the more likely they were to have a positive impact.

Many members of the LCPN thought that broadcasting environmental news was the most efficient and effective method of reaching a significant population. At the start of this project it was the only effort in the North Central Texas region to take advantage of this type of branded environmental information dissemination. As of March 2008, three other major news stations in the region have developed their own versions of e-Life. This is evidence that the e-Life project has had a profound effect in the region.

Community Impact

Several entities across the North Central Texas region have indicated that the e-Life project has had a positive impact on their community. Most evidence of the influence has come from the project website; although, the on-air feature seems to have served as a catalyst for increasing environmental news coverage across the region. Citizens are using the e-Life website as a tool to learn more about environmental issues. For instance, teachers and students in the Garland Independent School District (GISD) have used the information provided to assist with students' school projects. The City of Lewisville staff also introduced the e-Life project website to the Lewisville Independent School District (LISD) as an aid for the Major Rivers Education Program for Texas 4th graders. The website not only targeted adults, but there were several features such as the "Learning Center" interactive graphics that children could easily relate to and appreciate.

Targeting children and using them to spread environmental information is a great way for parents to learn about the environment and to take steps necessary to protect the earth's resources. Many parents are in tune with what their child is learning at school or in informal education programs, and conversations about what he/she learned that day offers a means for information exchange. Often times it is the student who encourages the parents to take action; whether it be to recycle, turn off the lights/water when not in use, or to use less pesticide/fertilizer on the yard. Because children can have a huge impact on their parents' attitudes and behaviors when it comes to the environment, using teachers to spread information to students and then to parents was a successful piece of the project. The LCPN, like the City of Garland and the City of Lewisville, were major players in getting the word out to local schools and communities about the e-Life project.

Local communities are now more aware of the factors that influence their environmental quality of life, and are taking steps in the right direction to improve water quality and the overall environment. For instance, the City of Garland noticed a sudden interest in pet waste, particularly dog waste, since the e-Life project began in 2006. Several Garland homeowners' associations

FINAL REPORT

have requested that signage be placed in their neighborhoods to remind residents to pick up after their dog(s). Over the past two years, at least 4 ENS were aired on CBS/KTVT-11 and uploaded to the project website to educate the public on the health and water quality impacts of pet waste. Countless other local media have also promoted proper pet waste management through news articles, etc. While it is not clear that the homeowners' associations were directly influenced by the e-Life project, e-Life likely had a hand in spurring this interest due to its influence on the region and environmental coverage by other news stations.

Content Generation

The LCPN were also responsible for generating local content to be incorporated into on-line and/or on-air ENS. The LCPN—made up of experts from a variety of different backgrounds and fields—provided input and story content at a local level to keep the e-Life project relevant to the Upper Trinity River Watershed. The public is concerned about what's happening in their backyards and without the LCPN the e-Life project would not have had the same impact.

Challenges

Staff turnover was the biggest obstacle to the e-Life project. NCTCOG and CBS/KTVT-11 both experienced staff changes during Phase II of the project period. This created a need for new staff to become familiar with the project, spending time that otherwise could have been spent enhancing the e-Life project. During these transitional periods, more tenured StormCenter, NCTCOG, and CBS/KTVT-11 staff helped to keep up project momentum.

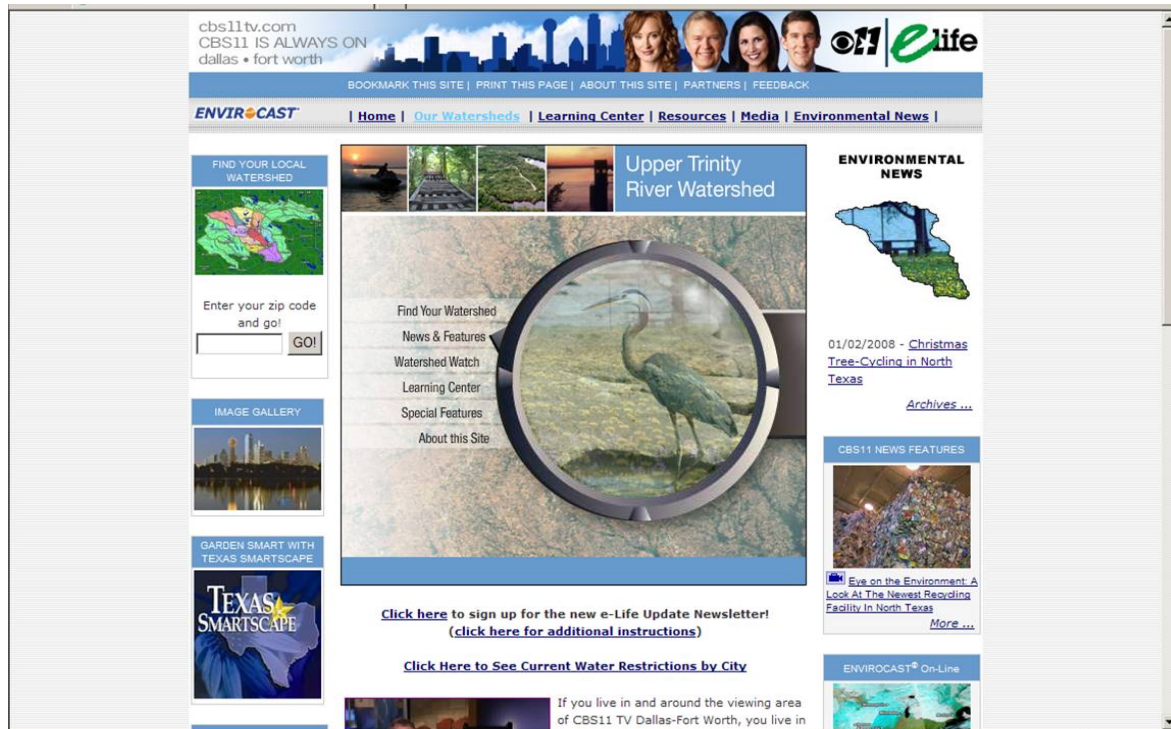

A post-campaign awareness survey, which the e-Life project lacked, could have been useful in demonstrating the project's success. A pre-campaign awareness survey conducted by the University of North Texas (UNT) in 2005 surveyed citizens in the Upper Trinity River Watershed to determine their knowledge, understanding, and concerns on water and watershed issues. A follow up to this survey at the end of the e-Life project would help identify current levels of citizen knowledge about water issues. Whether current levels represent an increase or decrease in knowledge from the pre-project awareness survey could be related to the e-Life project. Though we lack such supporting data, it is our belief that the North Central Texas public is currently more aware of environmental issues across the region than it was in 2005 and that more citizens are applying this knowledge to their everyday activities in an effort to protect our natural resources. It would be difficult to award this gain in knowledge entirely to the e-Life project, as there are several "green" initiatives going on across the region to educate the public on their environmental footprints. Despite these limitations, however, we believe e-Life has played a role in achieving an increase in public awareness of the relationship of water to the larger North Texas environment.

CONCLUSION

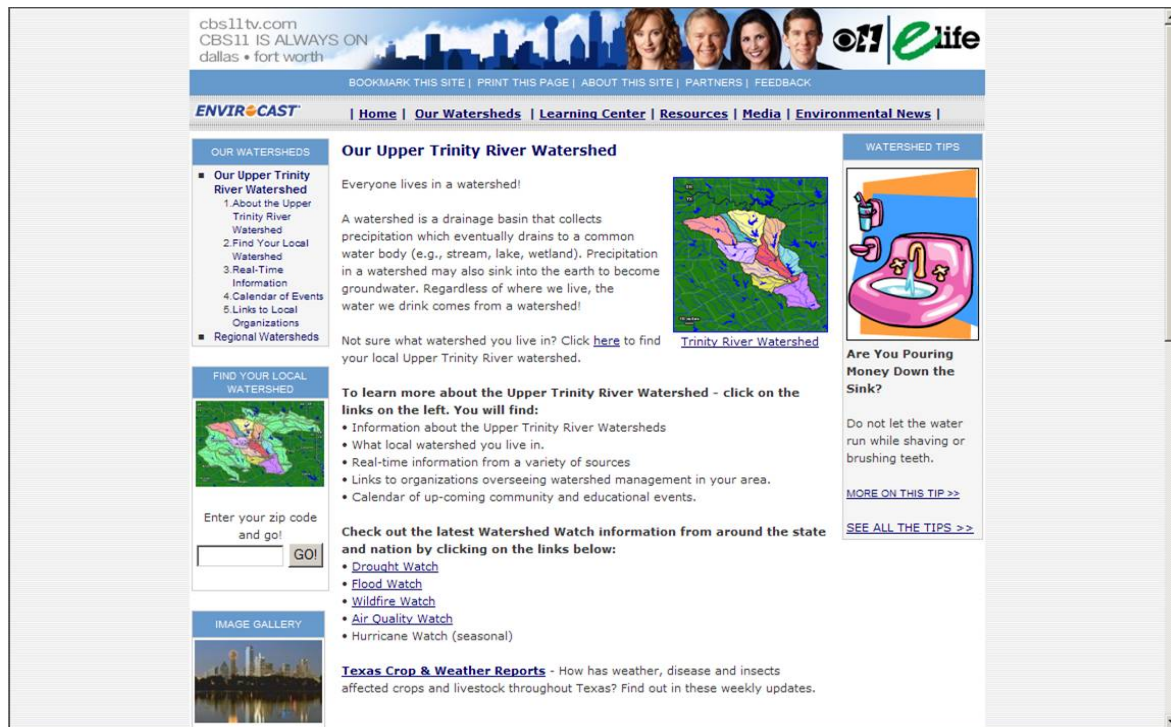

The e-Life project was successful at increasing awareness about local environmental issues to promote a systemic change in the attitude and behavior of citizens to protect watershed resources in North Central Texas. The on-air and on-line components of the project provided the distribution and communication mechanisms necessary to disseminate environmental science information to the public effectively and efficiently. Station viewership and on-line page loads provided evidence that the public was interested in learning about their environmental quality of life and how to protect watershed resources and the environment in North Central Texas.

National Watersheds: Mid-Atlantic

Geographic Features

The Mid-Atlantic watershed drainage area ultimately discharges into: (a) the Atlantic Ocean within and between the states of New York and Virginia; (b) Long Island Sound south of the New York-Connecticut State Line; and (c) the Riviere Richelieu, a tributary of the St. Lawrence River, includes all of Delaware and New Jersey and the District of Columbia, and parts of Connecticut, Maryland, Massachusetts, New York, Pennsylvania, Vermont, Virginia, and West Virginia.

About the Watershed

- Take a tour of the Mid-Atlantic Region by clicking here www.epa.gov/maia/html/tour.html

Most of the people in the mid-Atlantic region live in the urban corridor between the District of Columbia and New York City. Population growth is highest in the coastal plain, near the ocean and the estuaries; growth is flat or negative in the western areas of the region. Historically, people have settled where rich farmland and navigable rivers offer abundant food and easy transportation. Major metropolitan areas were built on the Region's waterways. New York City is located on the Hudson River; Philadelphia is on the Delaware River; Harrisburg on the

National Estuary Program
www.epa.gov/owow/estuaries/
The National Estuary Program was established in 1987 by amendments to the Clean Water Act to identify, restore, and protect nationally significant estuaries of the United States. The NEP targets a broad range of issues and engages local communities in the process. The program focuses not just on improving water quality in an estuary, but on maintaining the integrity of the whole system -- its chemical, physical, and biological properties, as well as its economic, recreational, and aesthetic values. Each NEP is made up of representatives from federal, state and local government agencies responsible for managing the estuary's resources, as well as members of the community -- citizens, business leaders, educators, and researchers. These stakeholders work together to identify problems in the estuary, develop specific actions to address those problems, and create and implement a formal management plan to restore and protect the estuary. Twenty-eight estuary programs are currently working to safeguard the health of some of our Nation's most important coastal waters.

Window to My Environment
www.epa.gov/enviro/wme
Window to My Environment is a powerful new web-based tool that provides a wide range of federal, state, and local information about environmental conditions and features in your local community. By typing in your zip code, city, or zooming in on a map, you can link to information from federal, state, and local partners to find out about air and water quality, watershed health, Superfund sites, fish advisories, impaired waters, as well as local services working to protect the environment in your area. An Interactive Map shows the location of regulated facilities, monitoring sites, water bodies, population density, perspective topographic views and much more. Full coverage for the entire United States should be available by the end of 2002.

Water Where You Live

Native and adapted plants require 80% less water, once they are established, than do other plants. • Consider replacing non-native grasses with native Texas prairie grasses. Or, consider reducing the size of your lawn area and adding large mulched beds of native and adapted plants. • Native and adapted plants also require fewer fertilizers and pesticides, which means that less pollution runs off lawns, down the storm drain, and into our creeks, rivers, and lakes. • Gardening and birding are two of the fastest growing hobbies in America. Native and adapted plants are great for gardening and many attract birds, bees, and butterflies. • 50% of your irrigation can be lost to evaporation. Water between 8 p.m. and 10 a.m. to avoid this. • Don't let your money run down the storm drain! Minimize irrigation runoff. • Water deeply and infrequently to help plants develop deep roots. • Use 3" of organic mulch in bed areas to reduce watering frequency. • Don't bag 'em! Leave grass clippings on the lawn to help maintain moisture. • Measure how much water you're placing on the lawn to ensure you aren't watering too much. Stick a rain gauge in the lawn to see exactly how much water the lawn is getting. • Don't water in the rain - install a rain sensor on irrigation systems. • Drip irrigation is more efficient than spray irrigation; it delivers almost 95% of the water to plants. • Water every 5 to 7 days in the summer and every 15 to 20 days in the winter. • Online tools at www.txsmartscape.com can help gardeners build their own Smartscape. <ul style="list-style-type: none"> o Plant palette tool to help you design your landscape o Searchable database of native and adapted plants and trees that will thrive in North Texas. Search plant selections by color, amount of sun or water required, size, and

<div>RESOURCES<ul style="list-style-type: none">■ Web Links■ Organizations■ Brochures■ Glossaries■ Watershed Tips■ Forest Facts■ Coastal Facts</div> <div><div>Drive a Clean Machine brought to you by Southwest Kia</div><div>Drive a Clean Machine.</div></div> <div><div>FIND YOUR LOCAL WATERSHED</div><div></div><div>Enter your zip code and go! <input type="text"/> <input type="button" value="GO!"/></div></div> <div><div>IMAGE GALLERY</div><div></div></div>	<h3>Coastal Facts</h3> <p>FACT #1 About 10 percent of the world's coral reefs have been destroyed and 60 percent are in danger of a similar fate.</p> <p>FACT #2 More and more Americans are moving to vulnerable coastal areas threatened by erosion and other natural hazards. In 60 years, erosion will claim one in four houses within 500 feet of the coast.</p> <p>FACT #3 Coastal habitats support over 75 percent of our nation's commercial catch and 80 percent of recreational catch of fish and shellfish. Escalating population growth and development along the coast have destroyed or degraded half of the habitat that is critical to marine life and to sustained vitality of our coastal economies. Estuarine and coastal wetlands are disappearing at an alarming rate. These biological and ecologically important systems provide habitat for marine and terrestrial life, trap sediment, filter pollutants, recharge ground water, anchor shorelines, and prevent pollution. An important goal of NOAA's Ocean Service is to help coastal managers identify specific causes of wetland decline and reclaim these resources to ensure the sustainability of our nation's fisheries.</p> <p>FACT #4 One inch of rain on a one-acre paved parking lot produces 1,600% more runoff than the same amount on a one-acre grassed meadow.</p> <p>FACT #5 Polluted runoff from urban and agricultural land is the leading cause of coastal water quality problems. Pollutants include sediments from eroding and overgrazed lands, fertilizers, pesticides, and animal waste. Once in the coastal environment, nutrients stimulate the growth of algae and other plants and animals, depleting the oxygen that nearly all marine animals depend on for survival.</p> <p>FACT #6 More and more Americans are moving to vulnerable coastal areas threatened by erosion and other natural hazards. In 60 years, erosion will claim one in four houses within 500 feet of the coast.</p> <p>FACT #7 Healthy coastal habitats produce more food per acre than the richest Midwestern farmland because of the fertile mix of nutrients from land and sea.</p> <p>FACT #8 Beyond providing food for our consumption, coastal habitats are the home of thousands of species of fish, birds, plants, and animals that depend on healthy habitat for their survival.</p> <p>FACT #9 The <i>Pfiesteria</i> outbreaks causing massive fish kills -- has harmed human health in those exposed to the toxic microbe, causing skin lesions and even memory loss. That's what happens when estuaries are</p>

GARDEN SMART WITH TEXAS SMARTSCAPE

TEXAS

Litter

Did you know? If you toss your trash in the lake or on the ground, it will be with us for years! Here's the time it takes some common items to decompose:

- Paper takes 2-4 weeks and wax-coated paper, such as fast food wrappers or cups, takes much longer
- Tin cans take 100 years
- Aluminum cans take 200-500 years
- Plastic six-pack rings or any other plastic take 450 years
- Glass bottles take more than 500 years

Where's the litter coming from? You! Trash that is left on the ground or thrown out your car window can wash into our local lakes and rivers through storm water runoff.

What's the problem? Trash can choke or strangle animals and make a body of water look ugly.

How does this affect recreation?

- Trash in a body of water can:
 - o [kill fish](#)
 - o [keep boaters away](#)
 - o [keep swimmers away](#)

What can I do? Never throw your trash on the ground, in the water, or out your car window. Recycle what you can and throw the rest away in a trashbin. Before throwing away plastic six-pack rings, cut it into pieces. On residential trash or recycling days, cover the trash bin and recycling bin with a lid to keep trash from blowing into the street. If you don't use a trashbin, make sure all loose trash is secured in a trash bag. If you see someone littering in the North Texas area, [report them!](#)

Appendix AD: Motor Oil/Fuel Web Page

MOTOR OIL/FUEL

Drive a Clean Machine brought to you by Southwest Kia

FIND YOUR LOCAL WATERSHED

Enter your zip code and go!

GO!

IMAGE GALLERY

GARDEN SMART WITH TEXAS SMARTSCAPE

TEXAS

Motor Oil/Fuel

Did you know? One-quart of spilled oil can create an oil slick as large as three football fields and remain in the area for up to two years.

Where's the motor oil/fuel coming from? Motor oil or fuel can enter the body of water directly if you dump your boat or car's used motor oil in the lake, have a leak in your oil/fuel tank, or overfill your boat's tank. Motor oil or fuel can also enter a body of water through neighborhood storm water runoff that discharges from storm drains. Even if you think your car is out of harm's way sitting in your driveway, storm water runoff can pick up the oil or fuel that is leaking on the driveway.

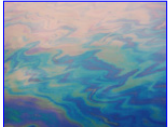

What's the problem? Oil and fuel can contaminate a body of water.

How does this affect recreation?

- Oil/fuel in a body of water can:
 - o [kill fish](#)
 - o [harm swimmers](#)

What can I do? Recycle or dispose of your motor oil properly. On or off the lake, take used motor oil to a facility that accepts hazardous wastes. Never top off your tank, particularly while filling up your boat's tank on the lake. Many fuel stations on the lake do not have an automatic shutoff, so pay attention to avoid overfilling your tank and spilling fuel in the lake. Keep your boat and car properly tuned to avoid leaks in the lake and on the road.

[Back to Recreation Overview](#)

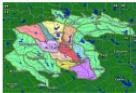

Appendix AE: Detergent Web Page

DETERGENT

Drive a Clean Machine brought to you by Southwest Kia

FIND YOUR LOCAL WATERSHED

Enter your zip code and go!

GO!

IMAGE GALLERY

GARDEN SMART WITH TEXAS SMARTSCAPE

Detergent

Did you know? One gallon of liquid soap washed down a storm drain can pollute up to 200,000 gallons of water.

Where's the detergent coming from? The wash water that results from washing your car or boat in your driveway eventually finds its way to our lakes. Washing your boat directly on the lake is even more problematic because the wash water is deposited directly in the lake.

What's the problem? Detergent is a major source of nutrients and pollutants.

How does this affect recreation?

- Detergents in a body of water can:
 - [kill fish](#)
 - [keep swimmers away](#)
 - [keep boaters away](#)
 - [harm swimmers](#)

What can I do? Wash your boat or car at a commercial boat/car washing facility. Many boat/car washing facilities are required to treat and reuse wash water while wash water that runs off your driveway is not treated or cleaned. If you must wash your boat or car at your house do so in a place where the water will drain onto your lawn. The lawn can help filter out the nutrients and pollutants before reaching the storm drains.

[Back to Recreation Overview](#)

Appendix AF: Pet/People Waste Web Page

PET/PEOPLE WASTE

Drive a Clean Machine brought to you by Southwest Kia

FIND YOUR LOCAL WATERSHED

Enter your zip code and go!

GO!

IMAGE GALLERY

GARDEN SMART WITH TEXAS SMARTSCAPE

Pet/People Waste

Did you know? Waste—poop—from pets and people is a major source of bacteria, which can be harmful to humans, plants, and animals.

Where's the pet/people waste coming from? Children who may use the bathroom in the lake can cause this type of pollution. In addition, parents who might empty an infant's dirty diaper into the lake or on the ground can add to the problem. Also, pet waste left along the banks of the lake or in your backyard can wash into the lake through storm water runoff.

What's the problem? Pet and people waste is a source of nutrients and bacteria.

How does this affect recreation?

- Pet/people waste in a body of water can:
 - [kill fish](#)
 - [keep swimmers away](#)
 - [keep boaters away](#)
 - [harm swimmers](#)

What can I do? Use a plastic bag to [pick up after your pet](#) at home and at the lake and dispose of it in a trash can or flush it down the toilet. Use the bathroom only in a restroom, not in the lake. Properly discard disposable diapers in a trashbin; flush the waste from diapers down the toilet. Also, the waste from your RV camper should be dumped at a proper collection facility, and should never be dumped in the lake or on the ground.

IMAGE GALLERY

GARDEN SMART WITH TEXAS SMARTSCAPE

TEXAS

Pesticides/Fertilizers

Did you know? Homeowners apply more pesticides on their lawn than farmers do on farmland.

Where are the pesticides/fertilizers coming from? The improper application of yard care products on residential landscapes is a major source of pesticides and fertilizers.

What's the problem? Pesticides can contaminate water with toxic substances and fertilizers are a source of nutrients.

How does this affect recreation?

- Pesticides/fertilizers in a body of water can:
 - o [kill fish](#)
 - o [keep swimmers away](#)
 - o [keep boaters away](#)
 - o [harm swimmers](#)

What can I do? **SmartScape®!** Landscape with native plants that require less fertilizers and pesticides. When using pesticides and fertilizers, follow the directions on the back of lawn care product packages and only apply the recommended amount. Never apply pesticides or fertilizers if rain is in the forecast or if it is very windy.

FIND YOUR LOCAL WATERSHED

Enter your zip code and go!

GO!

IMAGE GALLERY

GARDEN SMART WITH TEXAS SMARTSCAPE

TEXAS

Grass Clippings/Leaves

Did you know? Even though grass clippings and leaves are natural, they still pollute a lake or river.

Where are the grass clippings/leaves coming from? Homeowners or landscape maintenance companies that blow or sweep this yard waste into the street or down the storm drain.

What's the problem? Yard waste, like grass clippings and fallen leaves that are left in the street, sidewalk, or driveway or that are dumped, blown, or swept into the storm drain will eventually wash into nearby creeks, streams, rivers, and lakes during a storm or with the water runoff from water watering your lawn. Yard waste in a local waterway depletes the oxygen level in the water.

How does this affect recreation?

- Grass clippings/leaves in a body of water can:
 - o [kill fish](#)
 - o [keep swimmers away](#)
 - o [keep boaters away](#)

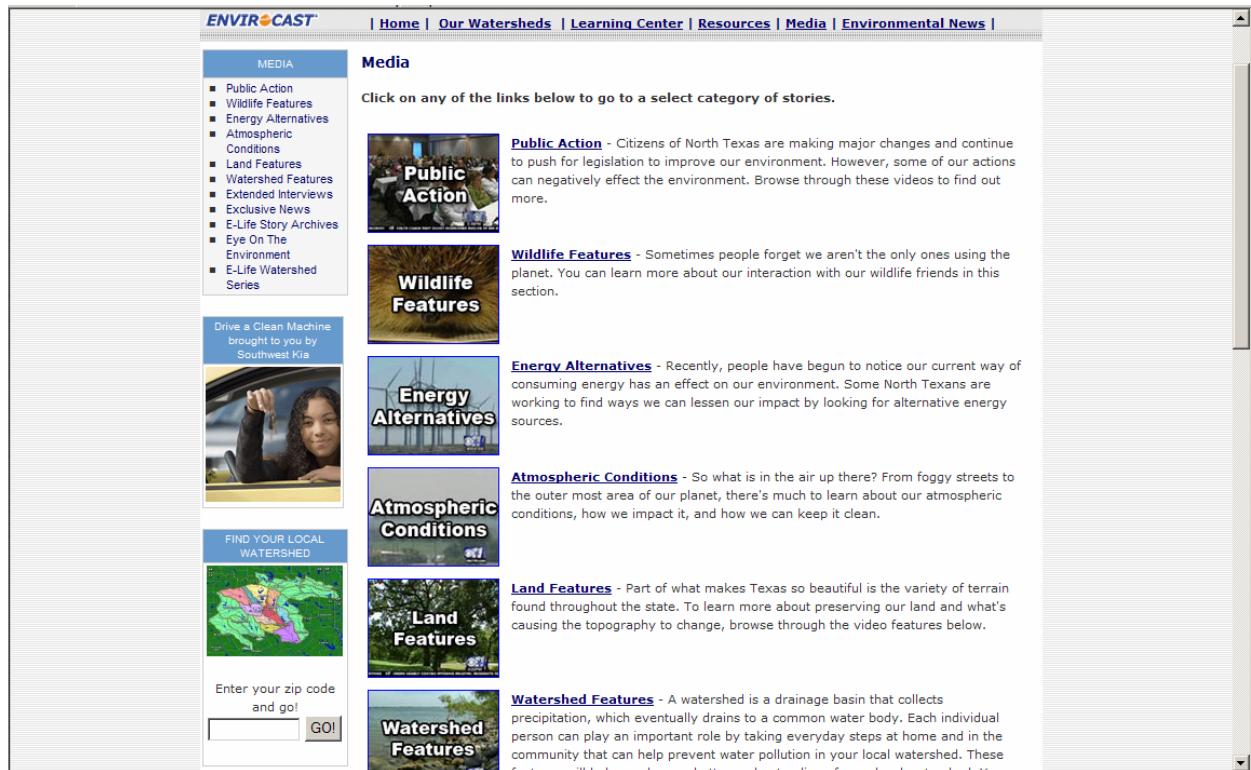

What can I do? Remove yard waste from the streets, sidewalks, and driveways. Blow or sweep grass clippings or fallen tree leaves back up into the yard where they can help provide additional nutrients to your lawn. Don't dump, sweep, or blow any yard waste down the storm drain. Use grass clippings or fallen tree leaves as mulch by shredding them and placing them around the yard to fertilize and protect landscape plants from extreme weather. Mulching mowers and blades make this easy, but be sure to clean up any yard waste that gets into the street. If you have a landscape maintenance company that cares for your yard, ask them to take the same precautions to keep yard waste out of the storm drain.

Appendix AU: On-Line/On-Air Story Ideas Developed by the LCPN

#	Story Idea
1	Responsible boating highlighting water quality
2	Water conservation
3	Summer outdoor activities for families featuring local parks, nature centers etc.
4	Composting as a summer activity
5	Invasive species propagated through boating
6	Litter prevention
7	Trinity River Clean Up in Elm Fork River near Lewisville
8	Trinity Trash Bash Challenge Issued
9	Texas Arbor Day Poster Contest from the Texas Forest Service
10	Arlington's Smart Yard Contest
11	Clean Pools, Polluted Waters
12	Clean Cars, Dirty Creeks
13	Celebrate National Estuaries Day by Viewing EstuaryLive!
14	Texas Spinach Producers Working to Keep Product Safe from E. Coli
15	Technotrash Recycling at University of Arlington
16	Texas Drought Losses Estimated at \$4.1 Billion
17	Bioenergy to be Focus of New Texas A&M System Alliance
18	Summertime Can Mean Blues for Lawns and Gardens
19	Fire Ant Awareness Week Helps Prevent Persistent Texas Pest
20	EPA kicks off regional ENERGY STAR Change a Light campaign
21	Trinity River Corridor Constructed Wetlands
22	\$16.1 Million in Drought-Aid for Texas Livestock Producers
23	Texas Researchers Casting for Answers to Stop Algae Problem in Texas Lakes
24	Fort Hood Joins EPA Partnership, Pledges Mercury Reduction
25	Area Creek Studied for Rangeland Effects on Water Quality
26	Mulch Demo in McKinney
27	Truckers driving toward environmental excellence (EPA SmartWay)
28	New Boardwalk Offers Giant Step into Texas Native Forest
29	"The 2030 Challenge" for Zero Greenhouse Emissions to be Outlined in Arlington
30	Texas Cooperative Extension Releases Second Round of Phorid Flies to Combat Fire Ants
31	EPA enforcement actions in Texas cut pollution, restore environment
32	TCEQ and Texas Parks and Wildlife Department (TPWD) statewide fish tissue sampling

FINAL REPORT

	project
33	Texas Parks and Wildlife Department receives Gulf Guardian Award for Coastal Expo
34	This Thanksgiving, Please Don't Feed the Storm Drain!
35	Deck the Halls, Not the Creeks!
36	Damage by Fire Ants in Rural Texas Estimated at \$236.5 Million
37	Majority of Texas wildfires are human-caused
38	Communities Against Trash, Dallas Park and Recreation Department
39	World Wetlands Day featuring North Central Texas wetlands
40	Managing Urban Wildlife... <i>"Planning for Success"</i>
41	Topping Trees Can Be Deadly
42	Rains Bring Large Fish Kills in East Texas
43	Keep your green—in your yard and in your wallet—SmartScape®!
44	Environmental performance takes off at world's third busiest airport
45	Managing Urban Wildlife Becoming Critical in Growing Cities, Suburbs
46	EarthKind Rose of the Year
47	Weatherford considers wetlands to filter wastewater
48	Proper application of fertilizer
49	Proper car maintenance, such as car washing and disposing of used motor oil
50	Composting
51	Fishing
52	Proper discharge of swimming pool water
53	Fall planting season – choose SmartScape
54	This Holiday, Please Don't Feed the Storm Drain!
55	Composting leaves
56	Winterizing your equipment (lawn mowers, boats, etc.)
57	Available outreach templates
58	Flooding-related safety issues in the Upper Trinity River watershed and in general
59	Environmentally friendly ways to deal with mosquitoes
60	Proper application of pesticides to minimize runoff in storm water
61	Ways homeowners can ensure that landscapers and yard care companies they hire use proper techniques to minimize NPS pollution
62	How animals and insects benefit from wet weather conditions
63	The benefits of rain gardens/rain harvesting on storm water quantity and quality
64	Urban populations of white-winged doves/white-winged dove banding
65	Water quality in construction site runoff
66	Need to check automatic sprinkler systems after a power outage to avoid wasting water
67	Implementation of a water reuse system at a municipal water district in the Upper Trinity River watershed
68	Green building initiatives and advances
69	Installation and testing of green roof technologies at a college in the Upper Trinity River watershed
70	Construction and demolition recycling efforts by cities in the Upper Trinity River watershed
71	Understanding the watershed's reservoir system and defining related vocabulary
72	Impacts of sanitary sewer overflows on water quality in the Upper Trinity watershed
73	The benefits of water on native habitats/aquatic wildlife
74	The transportation of trash and debris on the ground through storm water
75	Movement patterns of fire ants following rainfall events
76	Unmaintained pools can be grounds for mosquito breeding
77	Keep pool water from becoming a storm water pollutant
78	University of Texas at Arlington's solid waste award
79	Water conservation
80	Results of the annual Trash Bash
81	Green businesses
82	Benthic monitoring to help determine water quality

FINAL REPORT

83	Christmas tree recycling
84	Proper way to dispose of used turkey grease to avoid sewer overflows and water pollution
85	Winterizing your garage and how to properly dispose of unwanted chemicals
86	Protecting your car this winter—and protect our region's waters
87	Performing an energy audit
88	How to offset your holiday activities
89	The effect of throwing wrapping paper in the fireplace
90	Recycle wrapping paper and other gift accessories
91	How to be “green” while hunting
92	How to dispose of your pumpkin
93	Rather than throwing out fake trees find a way to use pieces of it in homemade crafts
94	Deadheading flowers in the winter gets rid of a major source of food for birds
95	Be selective about where you rake—leaf litter provides a home for skinks
96	“Green” gift ideas for the holidays
97	How to have an environmentally-friendly Super Bowl party
98	How to live green in 2008- “It’s easy being green”
99	Stress on water tanks during half-time of Super Bowls
100	Make a pledge to bring your lunch at least once a week
101	In the dead of winter you don’t need to water your lawn
102	How to avoid spreading bird diseases through bird feeders
103	Do-it yourself compost
104	Buy LED Christmas lights for next year
105	UTA’s green roof
106	Explain the difference between a bobcat and a mountain lion
107	“Binging Birds”
108	Trout stock update
109	Dallas’ green initiative to “building a greener city”
110	The delisting of an urban lake (Fosdic Lake) in Fort Worth from the 303(d) list of impaired water bodies
111	Sierra Club’s initiative on “Cool Cities”—cities taking action against Global Warming
112	Texas SmartScape® Month activities occurring throughout the region
113	Water conservation planning and sediment control
114	Heating water is a large expense in the home—how much energy does it take to transport heat?
115	Great American Cleanup related events occurring across the region
116	Earth Day/Arbor Day events occurring across the region
117	LEED certification
118	New green building initiatives
119	The benefits of trees (on storm water, energy use, etc.)
120	e-Life’s impact on the region

FINAL REPORT

Appendix BA: Project Promotion and Publication

#	Date	Promotional Feature/Item/Activity
1	April 2006	CBS/KTVT-11 News release announcing the e-Life project
2	April 6, 2006	Project kickoff with LCPN, CBS/KTVT-11, and StormCenter
3	April 18, 2006	Dave Jones, President & CEO of StormCenter, trained personnel of CBS/KTVT-11 on how to use, market, and promote e-Life
4	May 3, 2006	Presentation at "EPA-Getting in Step with Phase II"
5	May 10, 2006	Introduced e-Life to ~5000 students and teachers at the Kids Weather Day at Amerquest Field in Arlington
6	June 2, 2006	Informational display at NCTCOG's Regional Assembly
7	July 20, 2006	Presentation at the Preston Trail Chapter of the Texas Society of Professional Engineers
8	September 15, 2006	Presentation at the Upper Trinity Water and Watershed Educators Workshop
9	September 22, 2006	Presentation at the McKinney Rotary Club
10	September 29-October 22, 2006	Live mentions of the e-Life project during the State Fair of Texas
11	October 6, 2006	Premier at CBS/KTVT-11 headquarters with over 40 people in attendance
12	October 23-25, 2006	e-Life display booth at the TSSWCB district directors meeting
13	October 23-25, 2006	e-Life informational handouts distributed to 30 local teachers who attended the WEFTEACH 06 at the WEFTEC Conference in Dallas
14	November 2, 2006	EPA Region 6 employee presentation
15	May 2007	e-Life article ("e-Life Partnership Celebrates First Birthday") published in NCTCOG's Insider newsletter with circulation of ~1700 local government officials
16	June 2007	e-Life article ("Regional Projects Honored by TCEQ") published in NCTCOG's Insider newsletter with circulation of ~1700 local government officials
17	November 2007	e-Life article ("e-Life Project with CBS-11 Going Strong") published in NCTCOG's Insider newsletter with circulation of ~1700 local government officials
18	2006-2007	CBS/KTVT-11 on-air commercials using the e-Life promo pieces
19	2006-2007	CBS/KTVT-11 on-air mentions of e-Life in scrolling banners during news broadcasts
20	February-September 2007	CBS/KTVT-11 monthly electronic e-Life newsletter distributed to approximately 91 subscribers
21	May 2008	e-Life article ("Successful e-Life Project Spurs Regional Environmental Coverage") published in NCTCOG's Insider (now InSight) newsletter with circulation of ~1700 local governmental officials.
22	2006-2008	Provided updates at the Regional Storm Water Management Coordinating Council quarterly meetings
23	2006-2008	Posting of e-Life related events on the on-air Community Calendar feature of CBS/KTVT-11 and KTXA-21
24	2006-2008	CBS/KTVT-11 on-air mention of the project website at the end of each on-air ENS
25	2006-2008	Project information website linked to NCTCOG's storm water homepage
26	2006-2008	The on-line banner display of the e-Life logo was presented as a

FINAL REPORT

		hot spot on NCTCOG's Environment and Development homepage
27	2006-2008	News clips, web postings/links, poster and handout templates, newsletters, etc. through LCPN and other stakeholders

Appendix BB: e-Life Website Statistics (April 20, 2006 to April 30, 2008)

	Page Loads	Unique Visitors	First Time Visitors	Returning Visitors
Total	101,557	49,757	44,439	5,318
Average	137	67	60	7

Appendix BC: CBS/KTVT-11 Evening News Ratings (April 2006 to March 2008) (Nielson Media Research)

FINAL REPORT

Appendix BD: Web Site Statistics and Number of On-Air ENS per Quarter.

Appendix BE: Web Site Statistics for Days When an ENS is Aired.

FINAL REPORT

Appendix BF: Web Site Statistics for Days When an ENS is Not Aired.
